FOR IMMEDIATE RELEASE

SPATIALInfo Releases New Version of Enterprise Web Solution

SpatialWEB™ 4.3 adds support for advanced fiber network serviceability and fiber splice reporting

ENGLEWOOD, Colo. Oct. 3, 2011— [SPATIALInfo Inc.](http://www.spatialinfo.com), a leading provider of software that manages communications network assets, announced today the release of a new version of its [spatialWEB™](http://www.spatialinfo.com) product. SpatialWEB is an enterprise mapping solution that delivers network asset information quickly, easily, and cost effectively to meet specific needs across the communications organization. It helps companies improve decision making and operational efficiency by giving a wide range of users access to network asset information through standard web browser technology.

The new release builds on spatialWEB's rich map and data access capabilities, adding new functionality for service qualification in fiber optic networks, advanced reporting options for fiber splices, and additional user control over map layers. These new tools provide key benefits to users from sales and marketing to network operations and maintenance.

"The spatialWEB solution allows users across our customer organizations to view, browse, and query network assets in an easy-to-use, browser-based application," said SPATIALInfo CEO Greg Foster. "The latest release builds on that platform and delivers significant value to communication service providers managing complex fiber and cable networks."

SpatialWEB is a key component of the SPATIALInfo's spatialSUITE network management solutions that leverage a single enterprise asset database for many specific user needs such as design, planning, operational support, service qualification, and field operations. For more information on the latest version of spatialWEB and other offerings in the SPATIALInfo portfolio, visit <http://www.spatialinfo.com/products/spatialweb.html> or email enquiries@spatialinfo.com.

[About SPATIALInfo](#)

SPATIALInfo, with offices in Melbourne, Victoria and Englewood, Colorado, specializes in developing network-management software solutions for the cable and telecommunications industries. [SpatialSUITE products](#) make it easy for professionals to map, model and manage complex inside plant (ISP) and outside plant (OSP) communications networks. From the POI to the service address and everything in between, spatialSUITE's performance makes it the ideal choice for businesses that want to leverage the network asset data of their fiber, copper and RF networks. For more information, please call Karinn Koback at +1 720 873 6880 x122 or visit www.spatialinfo.com.
